-!- FUNCTION: GH AND GL FORM A COMPLEX THAT INDUCES NEUTRALIZING AND SYNCTIA HITBITING ANTIBODIES.

-!- MISCELLANEOUS: THERE ARE SEVEN EXTERNAL GLYCOPROTEINS IN HSV1 AND 2: GH, GB, GC, GG, GD, GI, AND GE.

-!- SIMILARITY: BELONGS TO THE HERPESVIRUSES GLYCOPROTEIN H FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     N-LINKED (GLCNAC. .)                                                                                                                                     -1-CATALYTIC ACTIVITY: RCH(2)NH(2) + H(2)O + acceptor = RCHO + NH(3) + reduced acceptor.
-1-COPACTOR: EACH OF THE SMALL SUBUNITS CONTAINS A COVALENTLY BOUND POQ-LIKE COPACTOR CALLED TRYPTOPHAN TRYPTOPHYLQUINONE (TTQ).
-1-SUBUNIT: TETRAMARR OF TWO LIGHT AND TWO HEAVY CHAINS.
-1-SUBCELLULAR LOCATION: PETIPLAGAMIC.
-1-SUBCELLULAR LOCATION: PETIPLAGAMIC.
-1-SIMILARITY: HIGH, TO OTHER SPECIES MADH LIGHT CHAIN.
                                      X-18 Y CRYSTALLOGRAPHY (2.25 ANGSTROMS).

Structure determination of quinoprotein methylamine dehydrogenase from Thiobacillus versutus.";
Acta Crystallogr. B 46:806 823(1990).
-!- FUNCTION: METHYLAMINE DEHYDROGENASE CARRIES OUT THE OXIDATION OF METHYLAMINE. ELECTRONS ARE PASSED FROM METHYLAMINE DEHYDROGENASE
TO AMICKANIN.
                                                                                                                                                                                                                                                                                                                                                                                                                      METHYLAMINE DEHYDROGENASE LIGHT CHAIN

Oldfleld S., Lowry C.A., Lightman S.L.;
ABC-transporter: WHITE2.",
Submitted (NOV-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: May be involved in macrophage lipid homeostasis.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Probable).
-!- SIMILARITY: BELONGS TO THE ABC TRANSPORTER FAMILY. ABGG (WHITE)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                       SUBCELLULAR LOCATION: Type II membrane protein. Golgi (Potential). SIMILARITY: BELONGS TO THE VERTEBRATE SIALVITRANSFERASE FAMILY.
                                                                                         "Molecular characterization of eukaryotic polysialyltransferase-1.";
Nature 373:175-718 (1995).
-1- FUNCTION: CATALYZES THE POLYCONDENSATION OF ALPHA-2, 8-LINKED
SIALIC ACID REQUIRED FOR THE SYNTHESIS OF POLYSIALIC ACID (PSA),
WHICH IS PREBERT ON THE EMBRYONIC NEURAL CELL ADHESION MOLECULE
(N-CAM), NECESSARY FOR PLASTICITY OF NEURAL CELLS.
                                                                                                                                                                                                                                                                                                                                                                                                                     EMBL; 246801; CAA86822.1; -.

-!- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE COMPLEX (COMPLEX LII OR CYTOCHROME B-C1 COMPLEX), WHICH IS A RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          BOUND TO THE PROTEIN.
SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
CYTOCHROME C1 AND THE RIESKE PROTEIN.
SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

EARLY ENDOSOMES.

-1- ALTERNATIVE PRODUCTS: AT LEAST 2 ISOFORMS; PC5B/LONG (SHOWN HERE)
AND PC5A/SHORT; ARE PRODUCED BY ALTERNATIVE SPLICING.
-1- TISSUE SPECIFICITY: PC5A IS EXPRESSED IN MOST TISSUES BUT IS MOST ABUNDANT IN THE INTESTINE AND ADRENALS. PC5B IS EXPRESSED IN THE INTESTINE, ADRENALS AND LONG BUT NOT IN THE BRAIN.
-1- DEVELOPMENTAL STAGE: WEAKLY EXPRESSED THROUGHOUT THE EMBRYO, EXCEPT IN THE DEVELOPING NERVOUS SYSTEM, THE RIBS AND THE LIVER, BOYT MAREDLY UPREDLY OF THE UNDERLY AT HIS STAGE, STRONG EXPRESSION IN THE MUSCLE OF THE INTESTINAL VILLI. ISOFORM A IS MOST ABUNDANT AT LEASE SHORT SHOWN AT SIGNIFICANT LEVELS OF THE INTESTINAL UPPELS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN).
LUMENAL, CATALYTIC (POTENTIAL).
N-LINKED (GLCNAC...) (POTENTIAL).
                                                                                                                                                                                                                                                                                                   PICC. Natl. Acad. Sci. U.S.A. 92:7031-7035(1995).

-I FUNCTION: CATALYZES THE POLYCONDENSATION OF ALPHA-2,8-LINKED SIALIC ACID REQUIRED FOR THE SYNTHERSIS OF POLYSTALIC ACID (PSA), WHICH IS PRESENT ON THE EMBRYONIC NEURAL CELLS.

-I PATHWAY: GLYCOSYLATION.
-I SUBCELLULAR LOCATION: Type II membrane protein. Golgi (Potential).
-I SUBCELLULAR LOCATION: Type II membrane protein. Golgi (Potential).
-I TISSUE SPECIFICITY: HIGHLY EXPRESSED IN FETAL BRAIN, LUNG AND KIDNEY AND IN ADULT HEARY, SPLEEN AND THYMUS. PRESENT TO A LESSER EXTENT IN ADULT BRAIN, PLACENTA, LUNG, LARGE AND SMALL INTESTINE AND PERIPHERAL BLOOD LEUKOCYTES:
-I SIMILARITY: BELONGS TO THE VERTEBRATE SIALYLTRANSFERASE FAMILY.
                                                                                                                                                                                                  MEDLINE-95550205; PubMed-7624364; Nakayama J., Fukuda M.; Ranscht B., Fukuda M.; Nakayama J., Fukuda M.N., Fredette B., Ranscht B., Fukuda M.; Eredette B., Ranscht B., Fukuda M.; Eredette B., Ranscht B., Fukuda M.; Polysialylated neural cell adhesion molecule present in embryonic brain.";

BLOL. Chem. 269:17872-17878(1994).
-!- FUNCTION: MAY TRANSFER SIALIC ACID THROUGH ALPHA-2,8-LINKAGES
TO THE ALPHA-2,3-LINED AND ALPHA-2,6-LINKED SIALIC ACID OF
TO THE ALPHA-2,3-LINED AND ALPHA-2,6-LINKED SIALIC ACID OF
N-LINKED OLIGOSACCHARIDES OF GLYCOPROTEINS AND MAY BE INVOLVED
IN PSA (POLYSIALIC ACID) EXPRESSION.
-!- PATHWAY: GLYCOSYLATION.
-!- SUBCELLULAR LOCATION: Type II membrane protein. Golgi (Potential).
-!- TISSUE SPECIFICITY: HIGHLY EXPRESSED IN FETAL BRAIN, KIDNEY AND
HEART AND TO A MUCH LESSER EXTENT IN ADULT HEART AND THYMUS.
-!- SIMILARITY: BELONGS TO THE VERTEBRATE SIALYLTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Angata K., Nakayama J., Fredette B., Chong K., Ranscht B., Fukuda M.; "Human STX polyslalyltransferase forms the embryonic form of the neural cell adhesion molecule. Tissue-specific expression, neurite outgrowth, and chromosomal localization in comparison with another polyslalyltransferase, PST.";
J. Biol. Chem. 272:7182-7190(1997).

SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN).
LUMENAL, CATALYTIC (POTENTIAL).
N-LINKED (GLCNAC. .) (POTENTIAL).
                                                                                                                                                                                                                                                                                                                          FEBS Lett. 360:1-4 (1995).

-!- FUNCTION: MAY TRANSFER SIALIC ACID THROUGH ALPHA-2, 8-LINKAGES TO THE ALPHA-2, 3-LINKED AND ALPHA-2, 6-LINKED SIALIC ACID OF N-LINKED OLIGOSACCHARIDES OF GIYCOPROTEINS, 6-LINKED BINVOLVED IN PSA (POLYSIALIC ACID) EXPRESSION (BY SIMILARITY).

-!- PATHWAY: GIYCOSYLATION.

-!- SUBCELLULAR LOCATION: Type II membrane protein. Golgi (Potential).

-!- SIMILARITY: BELONGS TO THE VERTEBRATE SIALYLTRANSFERASE FAMILY.
                                                                                                                                                                           MEDLINE=95180406; PubMed=7875291;

Tcloining and expression of Gal beta 1,3GalnAc-specific GalnAc alpha
2,6-sialyltransferase."
2,6-sialyltransferase."
3, Biol. Chem. 269:19048-19053(1994).
-!- CATALYTIC ACTIVITY: CAP.N-ACETYLNEURAMINATE + GIYCANO-BETA-D-GALACTOSAMINYL)-GLYCOPROTEIN = CMP
+ GLYCANO-BETA-D-GALACTOSYL.(2,6-ALPHA-N-ACETYLNEURAMINYL)-
- (N-ACETYL-D-GALACTOSYL.(2,6-ALPHA-N-ACETYLNEURAMINYL)-
- PATHWAY: GLYCOSYLATION:
- PATHWAY: GLYCOSYLATION:
- SUBCELLULAR LOCATION: Type II membrane protein. Golgi (Potential).
- TISSUE SPECIFICITY: HARRY, KIDNEY, TESTES, BRAIN, LIVER AND LUNG.
- DEVELOPMENTAL STAGE: ABUNDANTIY: EXPRESSED AT ALL EMBRYONIC STAGES
BUT NOT PRESENT IN ADULT TISSUES.
- SIMILARITY: BELONGS TO THE VERTEBRATE SIALYLTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. -!- SUBCELLULAR LOCATION: Type II membrane protein. Golgi (Potential).
-!- SIMILARITY: BELONGS TO THE VERTEBRATE SIALYLTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDLINE=97067198; pubMed=8910600;

KONO M., Yoshida Y., Kojima N., Tsuji S.;

Molecular clonding and expression of a fifth type of alpha2,8-

sialytransferase (ST8Sia V). Its substrate specificity is similar to

that of SAT-VIII, which synthesize GDIC, GTla, GQIb and GT3.";

SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN)
                    galactosaminyl-R.
PATHWAY: GLYGOSYLATION.
SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
FORM IN TRANS CISTERNAE OF GOLGI, SOLUBLE FORM IN BODY FLUIDS.
ALTERNATIVE PRODUCTS: TWO FORMS OF THIS ENZYME MAY ARISE BY
ALTERNATIVE SPLICING OF THE SAME GENE. A SHORTER FORM SEEMS
TO LACK A 40 RESIDUES INTERNAL SEGMENT.
                                                                                                                                                                                                                                                                 PROTEOLYTIC PROCESSING.
SIMILARITY: BELONGS TO THE VERTEBRATE SIALYLTRANSFERASE FAMILY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AC. ..) Lee Y.-C., Kurosawa N., Hamamoto T., Nakaoka T., Tsuji S.;
"Molecular cloning and expression of Gal beta 1,3GalNAc alpha 2,3sialyltransferase from mouse brain.";
Eur. J. Blochem. 216:377-385(1993).
-I- FUNCTION: IT MAY BE RESPONSIBLE FOR THE SYNTHESIS OF THE SEQUENCE
NEUAC-ALPHA-2,3-GAL-BETA-1,3-GALNAC-FOUND ON SUGAR CHAINS
O-LINKED TO THR ON SER AND ALSO AS A TERMINAL SEQUENCE ON CERTAIN
GANGLIOSIDES. SIAT4-A AND SIAT4-B STALKLATE THE SAME ACCEPTOR
SUBSTRATES BUT EXHIBIT DIFFERENT KM VALUES.

MEDLINE=93387288; PubMed=8375377;

SEQUENCE FROM N.A. NCBI_TaxID=10090;

TISSUE-Brain;

CATALYTIC ACTIVITY: CMP-N-acetylneuraminate + beta-D-galactosyl-1,3-N-acetyl-alpha-D-galactosaminyl-R - CMP + alpha-N-acetylneuraminyl-2,3-beta-D-galactosyl-1,3-N-acetyl-alpha-Dgalactosaminyl-R.
PATHWAY: GLYCOSYLATION.
SUBCELLOLLAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
FORM IN TRANS CISTERNAE OF GOLGI, SOLUBLE FORM IN BODY FLUIDS.
TISSUE SPECIFICITY: HIGHLY EXPRESSED IN SUBMAXILLARY GLAND AND
TO A MUCH LESSER EXTENT IN LIVER, LUNG, KIDNEY, HEART AND BRAIN.
PTM: THE SOLUBLE FORM DERIVES FROM THE MEMBRANE FORM BY -!- TISSUE

CMP-N-acetylneuraminate-beta-galactosamide-alpha-2,3-sialyltransferase
(EC 2. 4.99.4) (Reta-galactoside alpha-2,3-sialyltransferase) (Alpha 2,3-S.7) (Gal-NACGS) (Gal-beta-1,3-GalNAC-alpha-2,3-sialyltransferase)
(ST3GALIA) (ST3O) (ST3GALA.1) (STAT4-A).
                                                                                                                                                                                                                                                                             CYTOPLASMIC (POTENTIAL).
SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN)
SIMILARITY: BELONGS TO THE VERTEBRATE SIALYLTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens (Human).

"Mouse beta-galactoside alpha2,3-sialyltransferases: comparison of

"notice substrate specificities and tissue specific expression.";

Glycobiology 7:469-479(1997).

1.4-GLCAC-ALPHA-2,3-GAL-BETA-1,3-GAL-BETA-

1.4-GLCAC-, NEUAC-ALPHA-2,3-GAL-BETA-1,3-GLCALC-PAC-ALPHA-

2,3-GAL-BETA-1,3-GALNAC- SEQUENCES FOUND IT FERMINAL CARBOHYDRATE

GROUPS OF GLYCOPROTEINS AND GLYCOLIPIDS. THE HIGHEST ACTIVITY IS

TOWARD GAL-BETA-1,3-GLCNAC AND THE LOWEST TOWARD GAL-BETA-1,3-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -1-CATALTIC ACTIVITY: CMP-N-ACETYLNEURAMINATE + BETA-D-GALACTOSYL-1,3-N-ACETYL-D-GLUCOSAMINYL-GLYCOPROTEIN - CMP + ALPHA-N-ACETYL-D-GLUCOSAMINYL-GLYCOPROTEIN - CMP + ALPHA-N-GLUCOSAMINYL-GLYCOPROTEIN.
-1-PATHMAX: GLYCOPROTEIN.
-1-PATHMAX: GLYCOSYLATION.
-1-SUBCELLUAR LOCATION: Type II membrane protein.
-1-TISSUE SPECIFICITY: FOUND IN ALL TISSUES TESTED. HIGH EXPRESSION FOUND IN BRAIN, LIVER, KIDNEY, COLON, HEART AND SPLEEN.
-1-DEVELOPMENTAL STAGE: DEVELOPMENTAL STAGE: DATELOPMENTAL STAGE: DATECTOR STA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CYTOPLASMIC (POTENTIAL).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PROTEOLYTIC PROCESSING.
SIMILARITY: BELONGS TO THE VERTEBRATE SIALYLTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2,6-beta-D-galactosyl-1,4-N-acetyl-beta-D-galucosamine.
-!- PATHWAY: GLYCOSYLATION.
-!- SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND FORM IN TRANS CISTERNAE OF GOLGI, SOLUBLE FORM IN BODY FLUIDS.
-!- ALTERNATIVE PRODUCTS: 3 ISOFORMS; RIA (SHOWN HERE), RKA AND RKB; ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- TISSUE SPECIFICITY: STRONGLY EXPRESSED IN LIVER, SPLEEN, LUNG, KIDNEY AND SUBMAXILLARY GLAND AND WEAKLY IN HEART AND BRAIN.
-!- PTM: THE SOLUBLE FORM DERIVES FROM THE MEMBRANE FORM BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      O'Hanlon T.P., Lau K.M., Wang X., Lau J.T.Y.;
